

UWS | Manual Window Control Equipment

Manual controls have great environmental credentials as once installed they require little maintenance and draw no electricity. You achieve a double benefit, firstly of helping the environment by reducing electric usage and then also having those monetary savings!

This type of installation can also have large cost savings should your windows be in large banks of over four windows. Manual systems can control openings of upto six metres depending on the proportions and style of installation.

The controls that we install are surface mounted for ease of servicing. There are old systems that are fitting into the wall, however should there ever be a problem with the installation often the entire wall needs to be pulled apart to fix the problem. To overcome the visual intrusion that can be associated with the surface mounted system many of the parts can be colour matched

to your individual project to reduce the intrusion that they may cause.

The hand winders that are the operational mechanism can be placed at a level suitable for the installation. For a wheelchair friendly project the winders would be mounted much lower than those placed in a sports hall. These would be placed above a level where they wont be hit by a running player to ensure safety of the individual and the ongoing use of the equipment.

The pictures attached showcase our manual window controls which can be utilised in almost any home or building. This range of equipment only requires a yearly service to ensure everything is working in a functioning order.
